

Tech Tip - Captured Views

Verisurf has a function called Captured Views. This function provides the user the capability to save current states of the CAD levels, CAD Graphic position and MBD to quickly switch from one to another. The Captured View function is also able to import the Captured Views directly from a CATIA model. This also retains the MBD relationship to turn MBD on or off with the Captured View.

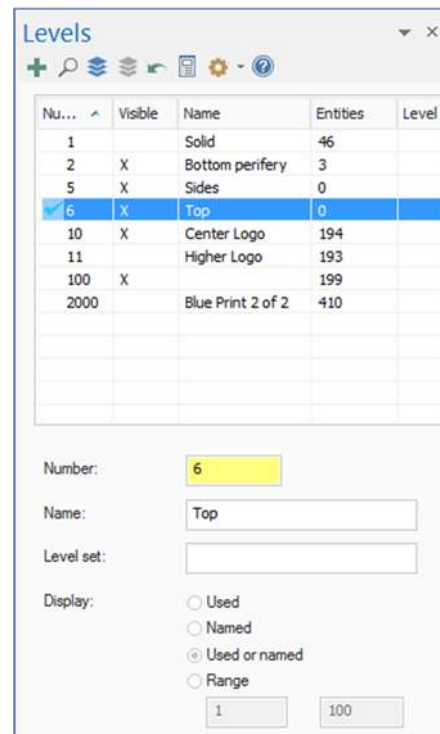

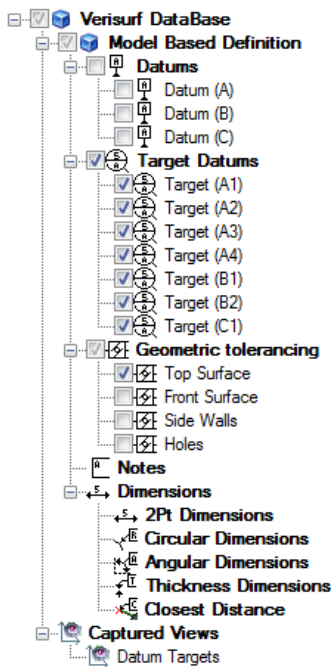

Adding Captured Views in the MBD Tree

When Adding Captured Views, you must be in the MBD Tree; to add a captured view you right click in the white space in the tree to bring the speed menu up. Then select the **Add Capture View**, this will save the current state of the CAD levels and MBD Tree.

Creating Captured Views

When Creating a Custom Captured View select the MBD you would like visible or not visible with the captured view. As well select the CAD entity Levels that you would like visible or not visible with the captured view. Position the CAD graphics in the way desired. Then perform the **Add Capture View** function in the right click speed menu. This will add a captured view to the tree.

Selecting Captured Views

When Moving from one Captured View to another you must left click on the Captured View to activate it. You are not able to use the Keyboard arrow keys or the drag function for the Captured Views. By selecting the Captured view it will dynamically orient the Model, select the CAD Levels on and turn on the MBD to the state it was captured at when creating the view.

Select the Captured View to switch to another state.

Turning on Captured Views in other Tree Layouts

Captured view can be activated in the Analysis, Measure and Reverse tabs. Right click in the white space in the operations manager to bring up the speed menu. Navigate to the Tree Layout - Captured Views to select and enable the Captured Views for the currently active Operations Manager Tree. You can only see and select active Captured Views except in the MBD tab in the Operations Manager where they are created.
